

On Some Recent Progress on Rosa-Type Labelings

S. I. El-Zanati, Illinois State University

Abstract

A *labeling* (or *valuation*) of a graph G is an assignment of integers to the vertices of G subject to certain conditions. A hierarchy of graph labelings was introduced by Rosa in the late 1960s. Rosa showed that certain basic labelings of a graph G with n edges yielded cyclic G -decompositions of K_{2n+1} while other stricter labelings yielded cyclic G -decompositions of K_{2nx+1} for all natural numbers x . Until recently, labelings of the latter type were defined only for bipartite and almost-bipartite graphs. We report on two new labelings for tripartite graphs and show that if a graph G with n edges admits either of these labelings, then there exists a cyclic G -decomposition of K_{2nx+1} for every positive integer x . We also discuss the multigraph extensions of the labelings.
